---

Rob,

Thank you for calling this morning. I have attached names of additional contacts that you can add to the meeting invite.

Dana has identified a risk of having suspect bearing cups SPL 100, built in driveshafts supplied to Ford OHAP.

Suspect bearing cups might present through hardness condition, due to non-proper disposition of non-conforming material, during heat treatment process. Through hardness has been caused by excessive time on HT furnace, due to quench pumps down (out of service).

Bearing cups SPL 100 are manufactured by Dana Lima, built on driveshafts by Dana Louisville, and supplied to Ford OHAP.

A total of 240 Ford vehicles built in Ford OHAP are suspect, and might contain bearing cups presenting through hardness condition. No other Ford locations received suspect product.

The effect of the failure is premature failure of the U-joint. Dana's containment had zero fall out after assembly process, indicating low risk of escapes. Even so, to eliminate the risk of having suspect material in our product, we recommend inspection and replacement of the potential non-conforming material.

Please provide us location of the suspect parts and vehicles, and Dana will conduct containment needed. Find attached list of vehicle serial numbers built with suspect bearing cups.

Any question or additional information please do not hesitate to contact us.

I need to clean up the spreadsheet a little more. It contains some SPL140 driveshafts that can be removed from the list. The PDF contains the original rack sheets and quantities of each shaft and of each type.
